# CorData WORMLock<sup>tm</sup>

Sarbanes-Oxley compliant  
WORM storage manager  
for the Storage Gateway Server

CorData's WORMLock Option for the Storage Gateway Server Helps enterprises to comply with proliferating data retention regulations while using cost effective disk as write-once-read-many (WORM) storage.

CorData WORMLock allows data archiving and retrieval based on a write-once-read-many (WORM) paradigm using existing storage, offering an alternative to cumbersome, expensive optical storage and costly, and proprietary specialized disk arrays.

## SGS WormLock<sup>tm</sup>

Most regulatory standards require that data be preserved unchanged for a specified period of time (see examples on the following page). Once the retention period has been reached, the data can be deleted.

With CorData WORMLock, a retention time policy can be configured for each WORMLock volume. Files are locked for the prescribed duration, after which they can be deleted. To enforce data integrity, CorData WORMLock can optionally attach a hidden digital signature to each file to uniquely identify it and certify that the contents have not been altered.

**CorData WORMLock is easy to use**

CorData WORMLock can be configured in just a few simple wizard-driven steps:

1. Allocate space from your all-purpose disk to become your WORMLock volume.
2. Set the policy for how long files need to be protected/locked.
3. Create shares for end-users so that they can copy files to the WORMLock volume(s).
4. End-users can then manually lock files or the administrator can establish a policy to automatically lock files.

“Storage Networking is a service, not a product”

## SGS WORMLock<sup>tm</sup>

CorData WORMLock enables organizations to meet all internal and external requirements associated with securing, protecting, and storing regulated information, in a highly available, yet cost effective environment.

Once a volume is established as a WORMLock volume, it cannot be changed, even by the administrator. For added security, CorData WORMLock offers authentication, access controls and permissions as well as audit logs.

To protect the integrity of each file's legitimate retention period, CorData WORMLock includes a built-in, independent clock that, unlike the computer's system clock, cannot be tampered with at any time.

Low Cost Storage  
Permanent Data Storage  
Centralized Management

Assignment of non-volatile data storage SAN-wide.  
Eliminates the possibility of archived data loss.  
Automated Scheduling and Storage Provisioning.
